ADC1210S series

Single 12-bit ADC; 65 Msps, 80 Msps, 105 Msps or 125 Msps; CMOS or LVDS DDR digital outputs

Rev. 03 — 2 July 2012 Product data sheet

1. General description

The ADC1210S is a single-channel 12-bit Analog-to-Digital Converter (ADC) optimized for high dynamic performance and low power consumption at sample rates up to 125 Msps. Pipelined architecture and output error correction ensure the ADC1210S is accurate enough to guarantee zero missing codes over the entire operating range. Supplied from a single 3 V source, it can handle output logic levels from 1.8 V to 3.3 V in CMOS mode because of a separate digital output supply. It supports the Low Voltage Differential Signalling (LVDS) Double Data Rate (DDR) output standard. An integrated Serial Peripheral Interface (SPI) allows the user to easily configure the ADC. The device also includes a programmable full-scale SPI to allow a flexible input voltage range from 1 V to 2 V (peak-to-peak). With excellent dynamic performance from the baseband to input frequencies of 170 MHz or more, the ADC1210S is ideal for use in communications, imaging and medical applications.

2. Features and benefits

- SNR, 70 dBFS; SFDR, 86 dBc
- Sample rate up to 125 Msps
- 12-bit pipelined ADC core
- Clock input divided by 2 for less jitter
- Single 3 V supply
- Flexible input voltage range: 1 V (p-p) to 2 V (p-p)
- CMOS or LVDS DDR digital outputs
- Pin compatible with the ADC1410S series and the ADC1010S series
- Input bandwidth, 600 MHz
- Power dissipation, 430 mW at 80 Msps
- Serial Peripheral Interface (SPI)
- Duty cycle stabilizer
- Fast OuT-of-Range (OTR) detection
- Offset binary, two's complement, gray code
- Power-down and Sleep modes
- HVQFN40 package

3. Applications

- Wireless and wired broadband communications
- Spectral analysis
- Ultrasound equipment
- Portable instrumentation
- Imaging systems
- Software defined radio

4. Ordering information

Table 1. Ordering information

Type number	f_s (Msps)	Package		
		Name	Description	Version
ADC1210S125HN-C1	125	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1210S105HN-C1	105	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1210S080HN-C1	80	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1
ADC1210S065HN-C1	65	HVQFN40	plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 × 6 × 0.85 mm	SOT618-1

Table 2. Pin description (CMOS digital outputs)

Symbol	Pin	Type [1]	Description
REFB	1	O	bottom reference
REFT	2	O	top reference
AGND	3	G	analog ground
VCM	4	O	common-mode output voltage
VDDA	5	P	analog power supply
AGND	6	G	analog ground
INM	7	I	complementary analog input
INP	8	I	analog input
AGND	9	G	analog ground
VDDA	10	P	analog power supply
VDDA	11	P	analog power supply
CLKP	12	I	clock input
CLKM	13	I	complementary clock input
DEC	14	O	regulator decoupling node
$\overline{OE}$	15	I	output enable, active LOW
PWD	16	I	power-down, active HIGH

Table 2. Pin description (CMOS digital outputs) *...continued*

Symbol	Pin	Type [1]	Description
D11	17	O	data output bit 11 (Most Significant Bit (MSB))
D10	18	O	data output bit 10
D9	19	O	data output bit 9
D8	20	O	data output bit 8
D7	21	O	data output bit 7
D6	22	O	data output bit 6
D5	23	O	data output bit 5
D4	24	O	data output bit 4
D3	25	O	data output bit 3
D2	26	O	data output bit 2
D1	27	O	data output bit 1
D0	28	O	data output bit 0 (Least Significant Bit (LSB))
n.c.	29	-	not connected
n.c.	30	-	not connected
DAV	31	O	data valid output clock
n.c.	32	-	not connected
VDDO	33	P	output power supply
OGND	34	G	output ground
OTR	35	O	out of range
SCLK/DFS	36	I	SPI clock data format select
SDIO/ODS	37	I/O	SPI data IO output data standard
$\overline{CS}$	38	I	SPI chip select
SENSE	39	I	reference programming pin
VREF	40	I/O	voltage reference input/output

[1] P: power supply; G: ground; I: input; O: output; I/O: input/output.

Table 3. Pin description (LVDS DDR) digital outputs)

Symbol	Pin [1]	Type [2]	Description
D10_D11_M	17	O	differential output data D10 and D11 multiplexed, complement
D10_D11_P	18	O	differential output data D10 and D11 multiplexed, true
D8_D9_M	19	O	differential output data D8 and D9 multiplexed, complement
D8_D9_P	20	O	differential output data D8 and D9 multiplexed, true
D6_D7_M	21	O	differential output data D6 and D7 multiplexed, complement
D6_D7_P	22	O	differential output data D6 and D7 multiplexed, true
D4_D5_M	23	O	differential output data D4 and D5 multiplexed, complement
D4_D5_P	24	O	differential output data D4 and D5 multiplexed, true
D2_D3_M	25	O	differential output data D2 and D3 multiplexed, complement
D2_D3_P	26	O	differential output data D2 and D3 multiplexed, true
D0_D1_M	27	O	differential output data D0 and D1 multiplexed, complement
D0_D1_P	28	O	differential output data D0 and D1 multiplexed, true
n.c.	29	-	not connected

Table 3. Pin description (LVDS DDR) digital outputs *...continued*

Symbol	Pin [1]	Type [2]	Description
n.c.	30	-	not connected
DAVM	31	O	data valid output clock, complement
DAVP	32	O	data valid output clock, true

[1] Pins 1 to 16 and pins 33 to 40 are the same for both CMOS and LVDS DDR outputs (see Table 2).

[2] P: power supply; G: ground; I: input; O: output; I/O: input/output.

7. Limiting values

Table 4. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V_O	output voltage	pins D11 to D0 or pins D10_D11_P to D0_D1_P and D10_D11_M to D0_D1_M	–0.4	+3.9	V
V_{DDA}	analog supply voltage		–0.4	+3.9	V
V_{DDO}	output supply voltage		–0.4	+3.9	V
T_{stg}	storage temperature		–55	+125	°C
T_{amb}	ambient temperature		–40	+85	°C
T_j	junction temperature		-	125	°C

8. Thermal characteristics

Table 5. Thermal characteristics

Symbol	Parameter	Conditions		Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient		[1]	22.5	K/W
$R_{th(j-c)}$	thermal resistance from junction to case		[1]	11.7	K/W

[1] Value for six layers board in still air with a minimum of 25 thermal vias.

9. Static characteristics

Table 6. Static characteristics[1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Supplies						
V_{DDA}	analog supply voltage		2.85	3.0	3.4	V
V_{DDO}	output supply voltage	CMOS mode	1.65	1.8	3.6	V
		LVDS DDR mode	2.85	3.0	3.6	V
I_{DDA}	analog supply current	f_{clk} = 125 Msps; f_i = 70 MHz	-	210	-	mA
I_{DDO}	output supply current	CMOS mode; f_{clk} = 125 Msps; f_i = 70 MHz	-	12	-	mA
		LVDS DDR mode: f_{clk} = 125 Msps; f_i = 70 MHz	-	39	-	mA
P	power dissipation	ADC1210S125; analog supply only	-	630	-	mW
		ADC1210S105; analog supply only	-	550	-	mW
		ADC1210S080; analog supply only	-	430	-	mW
		ADC1210S065; analog supply only	-	380	-	mW
		Power-down mode	-	2	-	mW
		Sleep mode	-	40	-	mW
Clock inputs: pins CLKP and CLKM						
Low-Voltage Positive Emitter-Coupled Logic (LVPECL)						
$V_{i(clk)dif}$	differential clock input voltage	peak-to-peak	-	1.6	-	V
SINE wave						
$V_{i(clk)dif}$	differential clock input voltage	peak	-	±3.0	-	V
Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS)						
V_{IL}	LOW-level input voltage		-	-	$0.3V_{DDA}$	V

11. Application information

11.1 Device control

The ADC1210S can be controlled via SPI or directly via the I/O pins (Pin control mode).

11.1.1 SPI and Pin control modes

The device enters Pin control mode at power-up, and remains in this mode as long as pin $\overline{CS}$ is held HIGH. In Pin control mode, the SPI pins SDIO, $\overline{CS}$ and SCLK are used as static control pins.

SPI control mode is enabled by forcing pin $\overline{CS}$ LOW. Once SPI control mode has been enabled, the device remains in this mode. The transition from Pin control mode to SPI control mode is illustrated in Figure 15.

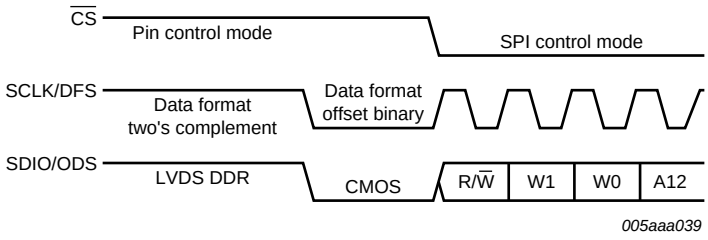

Fig 15. Control mode selection

When the device enters SPI control mode, the output data standard and data format are determined by the level on pin SDIO at the instant a transition is triggered by a falling edge on pin $\overline{CS}$.

11.1.2 Operating mode selection

The active ADC1210S operating mode (Power-up, Power-down or Sleep) can be selected via the SPI interface (see Table 20) or by using pins PWD and $\overline{OE}$ in Pin control mode, as described in Table 10.

Table 10. Operating mode selection via pin PWD and $\overline{OE}$

Pin PWD	Pin $\overline{OE}$	Operating mode	Output high-Z
LOW	LOW	Power-up	no
LOW	HIGH	Power-up	yes
HIGH	LOW	Sleep	yes
HIGH	HIGH	Power-down	yes

11.1.3 Selecting the output data standard

The output data standard (CMOS or LVDS DDR) can be selected via the SPI interface (see Table 23) or by using pin ODS in Pin control mode. LVDS DDR is selected when ODS is HIGH, otherwise CMOS is selected.

11.1.4 Selecting the output data format

The output data format can be selected via the SPI interface (offset binary, two's complement or gray code; see Table 23) or by using pin DFS in Pin control mode (offset binary or two's complement). Offset binary is selected when DFS is LOW. When DFS is HIGH, two's complement is selected.

11.2 Analog inputs

11.2.1 Input stage

The analog input of the ADC1210S supports a differential or a single-ended input drive. Optimal performance is achieved using differential inputs with the common-mode input voltage ($V_{I(cm)}$) on pins INP and INM set to $0.5V_{DDA}$.

The full-scale analog input voltage range is configurable between 1 V (p-p) and 2 V (p-p) via a programmable internal reference (see Section 11.3 and Table 22).

The equivalent circuit of the sample and hold input stage, including Electrostatic Discharge (ESD) protection and circuit and package parasitics, is shown in Figure 16.

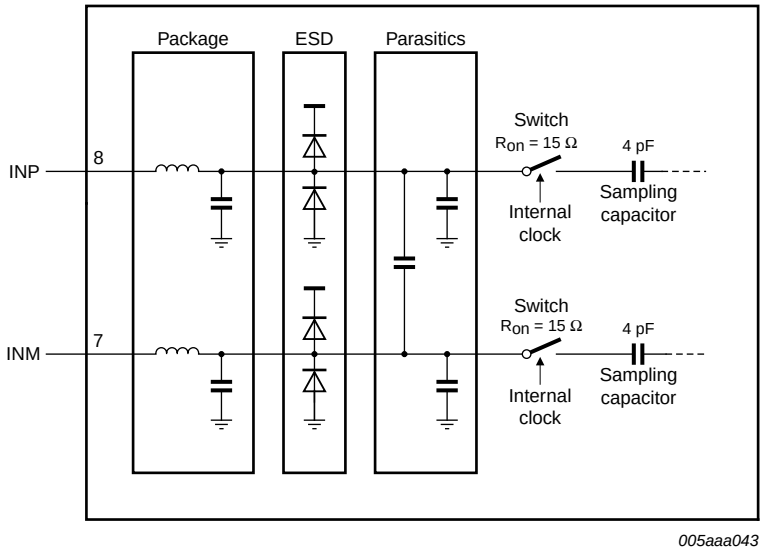

Fig 16. Input sampling circuit

The sample phase occurs when the internal clock (derived from the clock signal on pin CLKP/CLKM) is HIGH. The voltage is then held on the sampling capacitors. When the clock signal goes LOW, the stage enters the hold phase and the voltage information is transmitted to the ADC core.

11.2.2 Anti-kickback circuitry

Anti-kickback circuitry (R-C filter in Figure 17) is needed to counteract the effects of a charge injection generated by the sampling capacitance.

The RC filter is also used to filter noise from the signal before it reaches the sampling stage. The value of the capacitor should be chosen to maximize noise attenuation without degrading the settling time excessively.

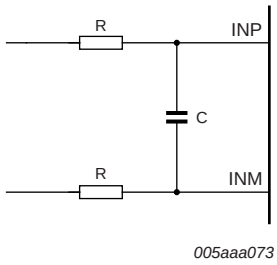

Fig 17. Anti-kickback circuit

The component values are determined by the input frequency and should be selected so as not to affect the input bandwidth.

Table 11. RC coupling versus input frequency, typical values

Input frequency	R	C
3 MHz	25 Ω	12 pF
70 MHz	12 Ω	8 pF
170 MHz	12 Ω	8 pF

11.2.3 Transformer

The configuration of the transformer circuit is determined by the input frequency. The configuration shown in Figure 18 would be suitable for a baseband application.

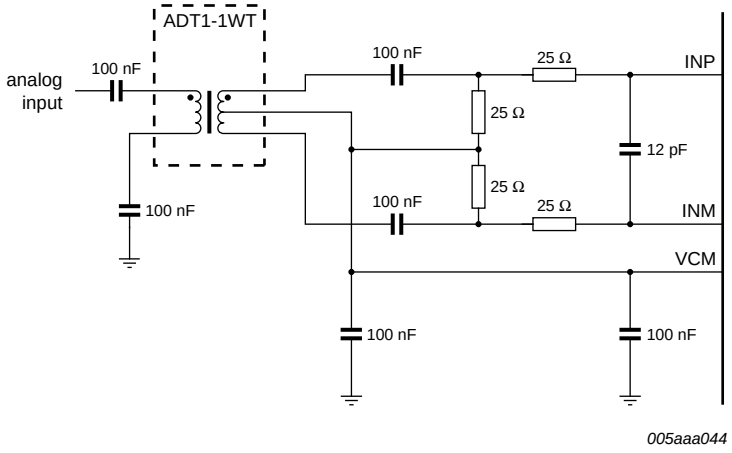

Fig 18. Single transformer configuration suitable for baseband applications

The configuration shown in Figure 19 is recommended for high frequency applications. In both cases, the choice of transformer is a compromise between cost and performance.

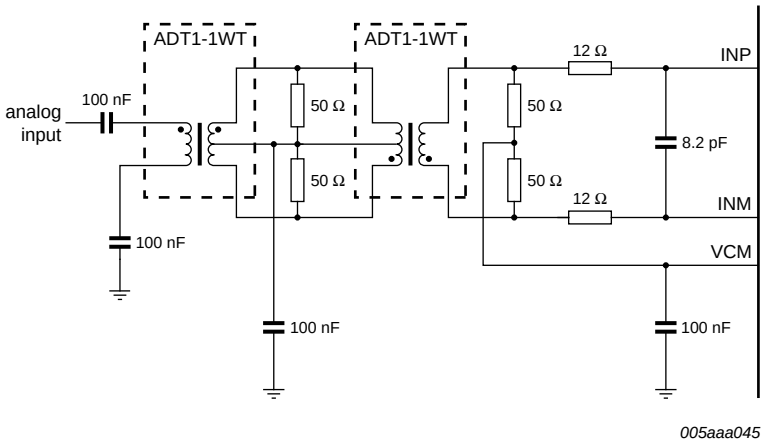

Fig 19. Dual transformer configuration suitable for a high intermediate frequency application

11.3 System reference and power management

11.3.1 Internal/external references

The ADC1210S has a stable and accurate built-in internal reference voltage to adjust the ADC full-scale. This reference voltage can be set internally via SPI or with pins VREF and SENSE (programmable in 1 dB steps between 0 dB and −6 dB via control bits INTREF[2:0] when bit INTREF_EN = logic 1; see Table 22). See Figure 21 to Figure 24. The equivalent reference circuit is shown in Figure 20. An external reference is also possible by providing a voltage on pin VREF as described in Figure 23.

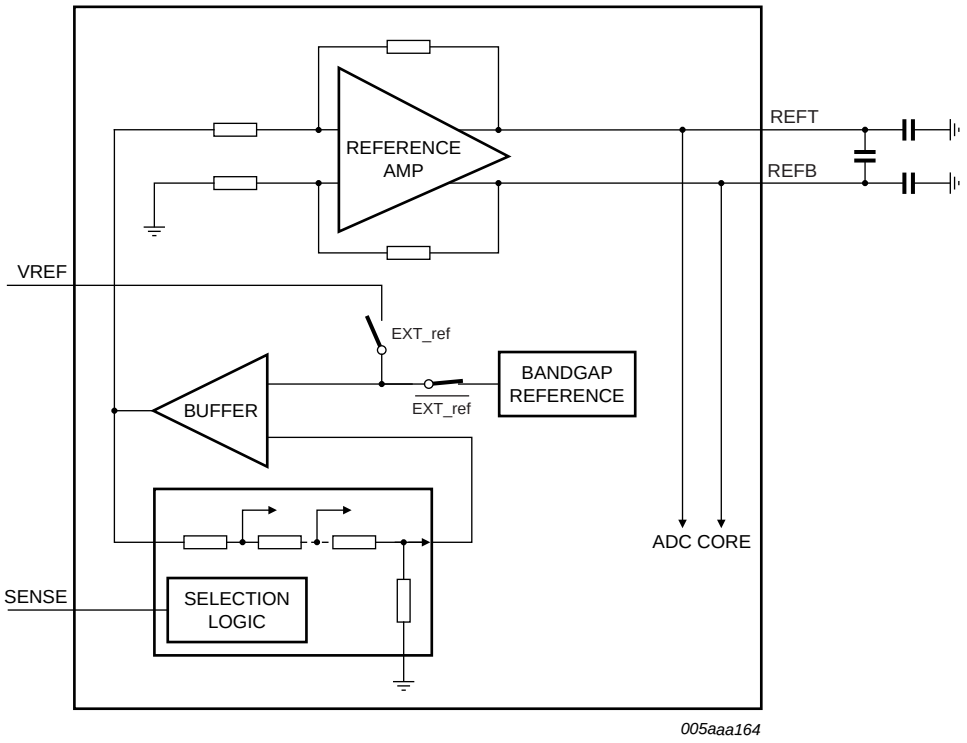

Fig 20. Reference equivalent schematic

If bit INTREF_EN is set to logic 0, the reference voltage is determined either internally or externally as detailed in Table 12.

Table 12. Reference selection

Selection	SPI bit INTREF_EN	SENSE pin	VREF pin	Full-scale (p-p)
internal (Figure 21)	0	AGND	330 pF capacitor to AGND	2 V
internal (Figure 22)	0	pin VREF connected to pin SENSE and via a 330 pF capacitor to AGND		1 V
external (Figure 23)	0	V_{DDA}	external voltage between 0.5 V and 1 V[1]	1 V to 2 V
internal via SPI (Figure 24)	1	pin VREF connected to pin SENSE and via 330 pF capacitor to AGND		1 V to 2 V

[1] The voltage on pin VREF is doubled internally to generate the internal reference voltage.

Figure 21 to Figure 24 illustrate how to connect the SENSE and VREF pins to select the required reference voltage source.

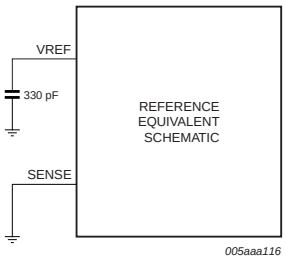

Fig 21. Internal reference, 2 V (p-p) full-scale

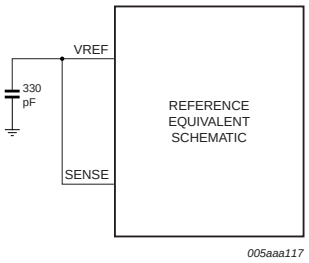

Fig 22. Internal reference, 1 V (p-p) full-scale

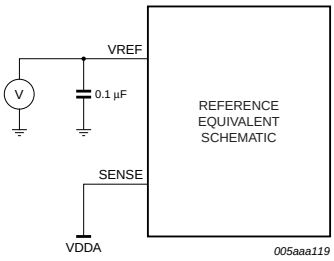

Fig 23. External reference, 1 V (p-p) to 2 V (p-p) full-scale

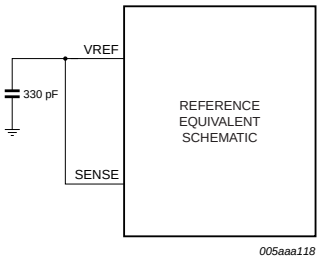

Fig 24. Internal reference via SPI, 1 V (p-p) to 2 V (p-p) full-scale

11.3.2 Programmable full-scale

The full-scale is programmable between 1 V (peak-to-peak) to 2 V (peak-to-peak) (see Table 13).

Table 13. Reference SPI gain control

INTREF[2:0]	Gain (dB)	Full-scale (V (p-p))
000	0	2
001	−1	1.78
010	−2	1.59
011	−3	1.42
100	−4	1.26
101	−5	1.12
110	−6	1
111	reserved	x

11.3.3 Common-mode output voltage ($V_{O(cm)}$)

A 0.1 μF filter capacitor should be connected between pin VCM and ground to ensure a low-noise common-mode output voltage. When AC-coupled, pin VCM can then be used to set the common-mode reference for the analog inputs, for instance via a transformer middle point.

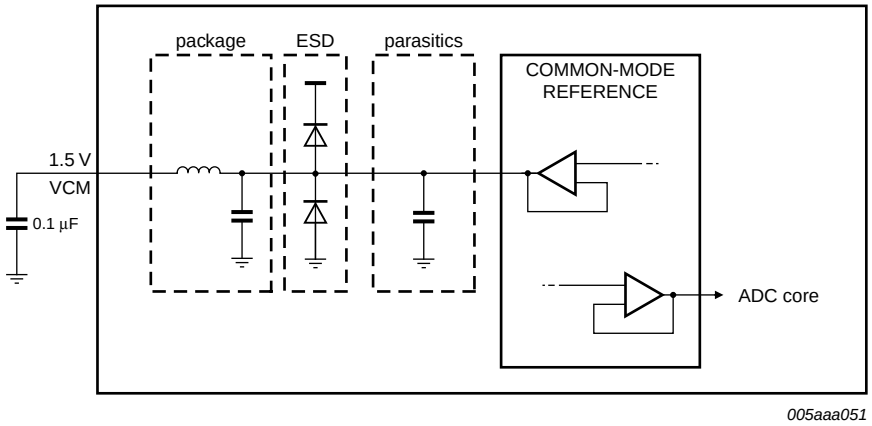

Fig 25. Equivalent schematic of the common-mode reference circuit

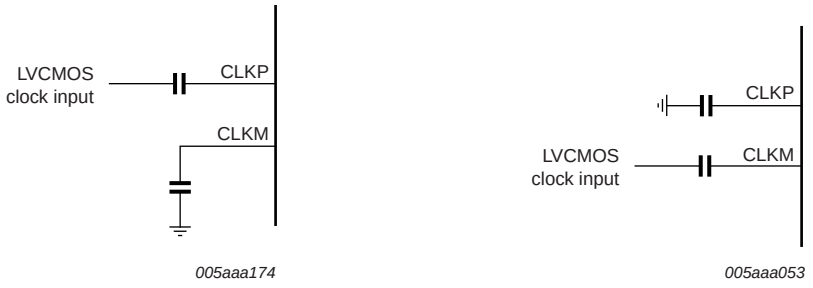
11.3.4 Biasing

The common-mode input voltage ($V_{I(cm)}$) on pins INP and INM should be set externally to $0.5V_{DDA}$ for optimal performance and should always be between 0.9 V and 2 V.

11.4 Clock input

11.4.1 Drive modes

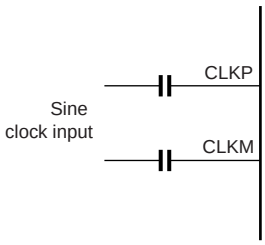
The ADC1210S can be driven differentially (LVPECL). It can also be driven by a single-ended Low Voltage Complementary Metal Oxide Semiconductor (LVCMOS) signal connected to pin CLKP (pin CLKM should be connected to ground via a capacitor) or pin CLKM (pin CLKP should be connected to ground via a capacitor).



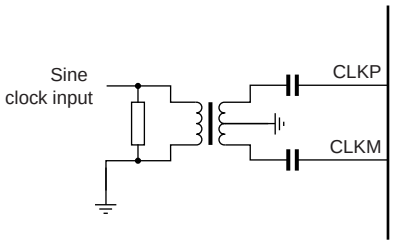
a. Rising edge LVCMOS

b. Falling edge LVCMOS

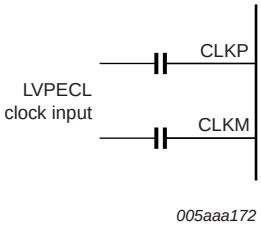
Fig 26. LVCMOS single-ended clock input



a. Sine clock input



b. Sine clock input (with transformer)

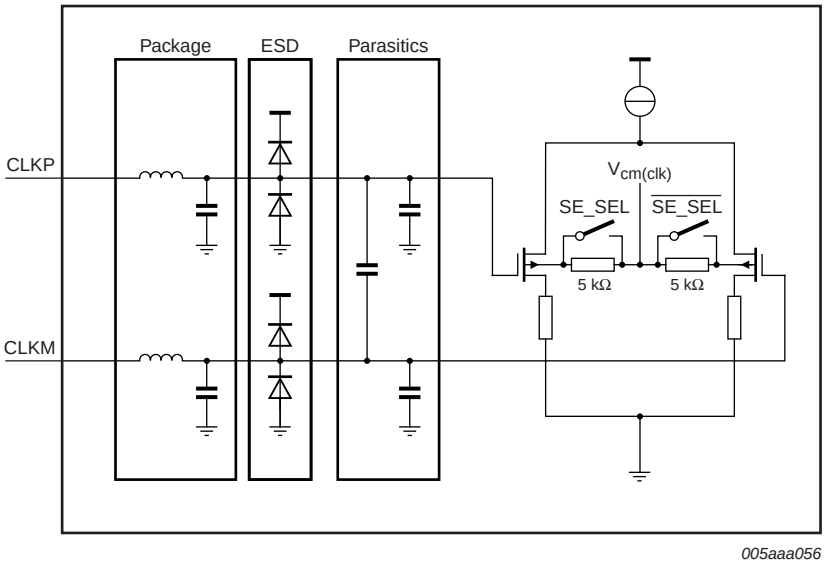


c. LVPECL clock input

Fig 27. Differential clock input

11.4.2 Equivalent input circuit

The equivalent circuit of the input clock buffer is shown in Figure 28. The common-mode voltage of the differential input stage is set via internal 5 kΩ resistors.



$V_{cm(clk)}$ = common-mode voltage of the differential input stage.

Fig 28. Equivalent input circuit

Single-ended or differential clock inputs can be selected via the SPI interface (see Table 21). If single-ended is enabled, the input pin (CLKM or CLKP) is selected via control bit SE_SEL.

If single-ended is implemented without setting bit SE_SEL to the appropriate value, the unused pin should be connected to ground via a capacitor.

11.4.3 Duty cycle stabilizer

The duty cycle stabilizer can improve the overall performance of the ADC by compensating the duty cycle of the input clock signal. When the duty cycle stabilizer is active (bit DCS_EN = logic 1; see Table 21), the circuit can handle signals with duty cycles of between 30 % and 70 % (typical). When the duty cycle stabilizer is disabled (DCS_EN = logic 0), the input clock signal should have a duty cycle of between 45 % and 55 %.

11.4.4 Clock input divider

The ADC1210S contains an input clock divider that divides the incoming clock by a factor of 2 (when bit CLKDIV = logic 1; see Table 21). This feature allows the user to deliver a higher clock frequency with better jitter performance, leading to a better SNR result once acquisition has been performed.

11.5 Digital outputs

11.5.1 Digital output buffers: CMOS mode

The digital output buffers can be configured as CMOS by setting bit LVDS_CMOS to logic 0 (see Table 23).

Each digital output has a dedicated output buffer. The equivalent circuit of the CMOS digital output buffer is shown in Figure 29. The buffer is powered by a separate power supply, pins OGND and VDDO, to ensure 1.8 V to 3.3 V compatibility and is isolated from the ADC core. Each buffer can be loaded by a maximum of 10 pF.

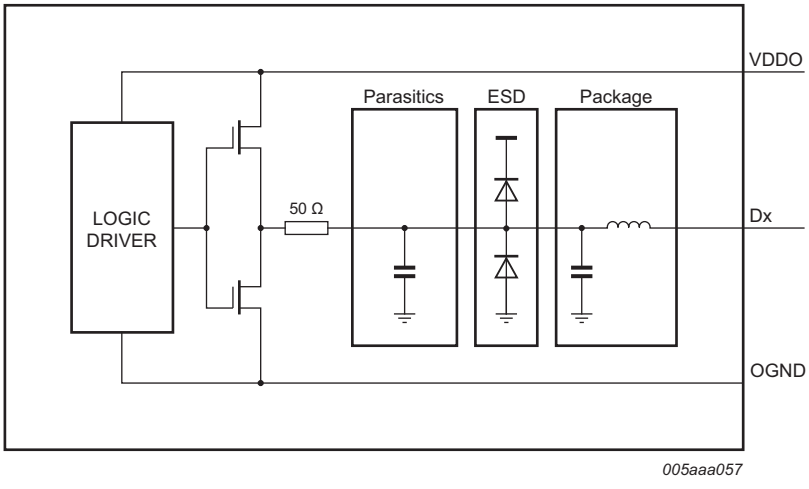


Fig 29. CMOS digital output buffer

The output resistance is 50 Ω and is the combination of an internal resistor and the equivalent output resistance of the buffer. There is no need for an external damping resistor. The drive strength of both data and DAV buffers can be programmed via the SPI in order to adjust the rise and fall times of the output digital signals (see Table 30).

11.5.2 Digital output buffers: LVDS DDR mode

The digital output buffers can be configured as LVDS DDR by setting bit LVDS_CMOS to logic 1 (see Table 23).

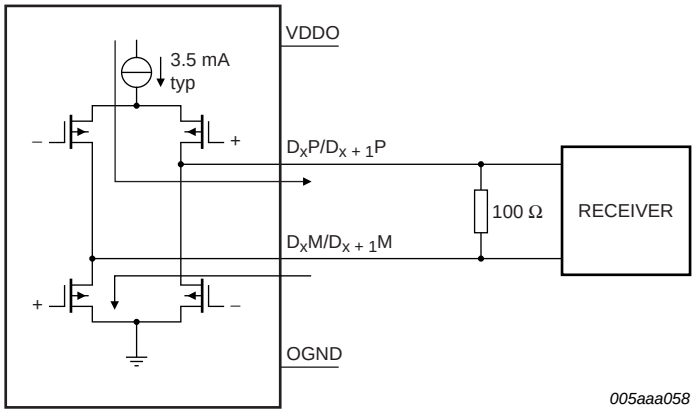

Fig 30. LVDS DDR digital output buffer - externally terminated

Each output should be terminated externally with a 100 Ω resistor (typical) at the receiver side (Figure 30) or internally via SPI control bits LVDS_INT_TER[2:0] (see Figure 31 and Table 32).

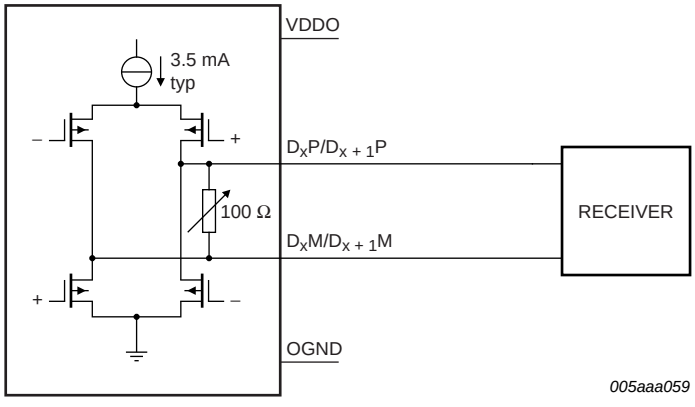

Fig 31. LVDS DDR digital output buffer - internally terminated

The default LVDS DDR output buffer current is set to 3.5 mA. It can be programmed via the SPI (bits DAVI[1:0] and DATAI[1:0]; see Table 31) in order to adjust the output logic voltage levels.

Table 14. LVDS DDR output register 2

LVDS_INT_TER[2:0]	Resistor value (Ω)
000	no internal termination
001	300
010	180
011	110
100	150
101	100
110	81
111	60

11.5.3 DAta Valid (DAV) output clock

A data valid output clock signal (DAV) can be used to capture the data delivered by the ADC1210S. Detailed timing diagrams for CMOS and LVDS DDR modes are shown in Figure 4 and Figure 5 respectively.

11.5.4 Out-of-Range (OTR)

An out-of-range signal is provided on pin OTR. The latency of OTR is fourteen clock cycles. The OTR response can be speeded up by enabling Fast OTR (bit FASTOTR = logic 1; see Table 29). In this mode, the latency of OTR is reduced to only four clock cycles. The Fast OTR detection threshold (below full-scale) can be programmed via bits FASTOTR_DET[2:0].

Table 15. Fast OTR register

FASTOTR_DET[2:0]	Detection level (dB)
000	−20.56
001	−16.12
010	−11.02
011	−7.82
100	−5.49
101	−3.66
110	−2.14
111	−0.86

11.5.5 Digital offset

By default, the ADC1210S delivers output code that corresponds to the analog input. However it is possible to add a digital offset to the output code via the SPI (bits DIG_OFFSET[5:0]; see Table 25).

11.5.6 Test patterns

For test purposes, the ADC1210S can be configured to transmit one of a number of predefined test patterns (via bits TESTPAT_SEL[2:0]; see Table 26). A custom test pattern can be defined by the user (TESTPAT_USER[11:0]; see Table 27 and Table 28) and is selected when TESTPAT_SEL[2:0] = 101. The selected test pattern is transmitted regardless of the analog input.

11.5.7 Output codes versus input voltage

Table 16. Output codes

$V_{INP} - V_{INM}$	Offset binary	Two's complement	OTR pin
< −1	0000 0000 0000	1000 0000 0000	1

> +1	1111 1111 1111	0111 1111 1111	1

11.6 Serial peripheral interface

11.6.1 Register description

The ADC1210S serial interface is a synchronous serial communications port that allows easy interfacing with many commonly-used microprocessors. It provides access to the registers that control the operation of the chip.

This interface is configured as a 3-wire type (SDIO as bidirectional pin).

Pin SCLK is the serial clock input and $\overline{CS}$ is the chip select pin.

Each read/write operation is initiated by a LOW level on pin $\overline{CS}$. A minimum of three bytes is transmitted (two instruction bytes and at least one data byte). The number of data bytes is determined by the value of bits W1 and W2 (see Table 18).

Table 17. Instruction bytes for the SPI

	MSB							LSB
Bit	7	6	5	4	3	2	1	0
Description	R/$\overline{W}$[1]	W1[2]	W0[2]	A12	A11	A10	A9	A8
	A7	A6	A5	A4	A3	A2	A1	A0

[1] Bit R/$\overline{W}$ indicates whether it is a read (logic 1) or a write (logic 0) operation.

[2] Bits W1 and W0 indicate the number of bytes to be transferred after the instruction byte (see Table 18).

Table 18. Number of data bytes to be transferred after the instruction bytes

W1	W0	Number of bytes transmitted
0	0	1 byte
0	1	2 bytes
1	0	3 bytes
1	1	4 bytes or more

Bits A12 to A0 indicate the address of the register being accessed. In the case of a multiple byte transfer, this address is the first register to be accessed. An address counter is increased to access subsequent addresses.

The steps involved in a data transfer are as follows:

1. A falling edge on $\overline{CS}$ in combination with a rising edge on SCLK determine the start of communications.
2. The first phase is the transfer of the 2-byte instruction.
3. The second phase is the transfer of the data which can vary in length but is always a multiple of 8 bits. The MSB is always sent first (for instruction and data bytes).
4. A rising edge on $\overline{CS}$ indicates the end of data transmission.

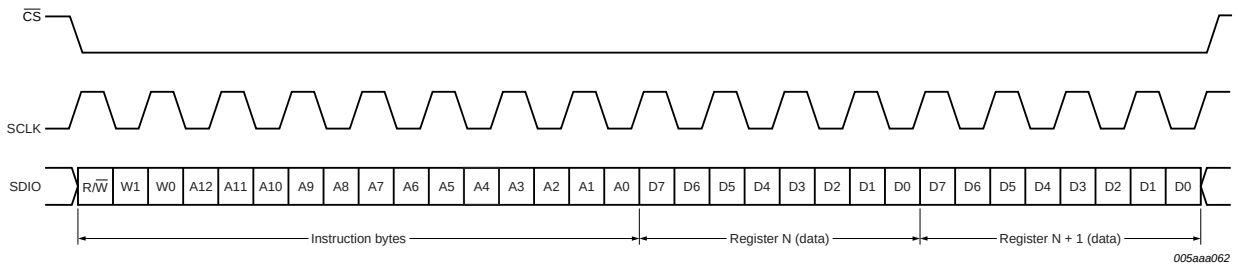

Fig 32. SPI mode timing

11.6.2 Default modes at start-up

During circuit initialization it does not matter which output data standard has been selected. At power-up, the device enters Pin control mode.

A falling edge on $\overline{CS}$ triggers a transition to SPI control mode. When the ADC1210S enters SPI control mode, the output data standard (CMOS/LVDS DDR) is determined by the level on pin SDIO (see Figure 33). Once in SPI control mode, the output data standard can be changed via bit LVDS_CMOS in Table 23.

When the ADC1210S enters SPI control mode, the output data format (two's complement or offset binary) is determined by the level on pin SCLK (gray code can only be selected via the SPI). Once in SPI control mode, the output data format can be changed via bit DATA_FORMAT[1:0] in Table 23.

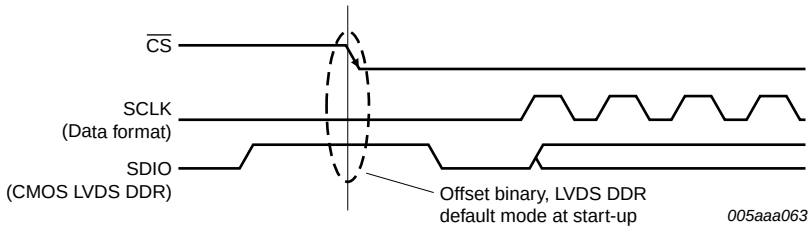

Fig 33. Default mode at start-up: SCLK LOW = offset binary; SDIO HIGH = LVDS DDR

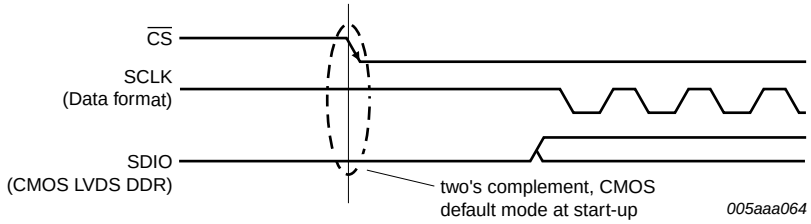

Fig 34. Default mode at start-up: SCLK HIGH = two's complement; SDIO LOW = CMOS

11.6.3 Register allocation map

Table 19. Register allocation map

Addr Hex	Register name	R/W	Bit definition								Default

			00	**3.5 mA**
			01	4.5 mA
			10	1.25 mA
			11	2.5 mA

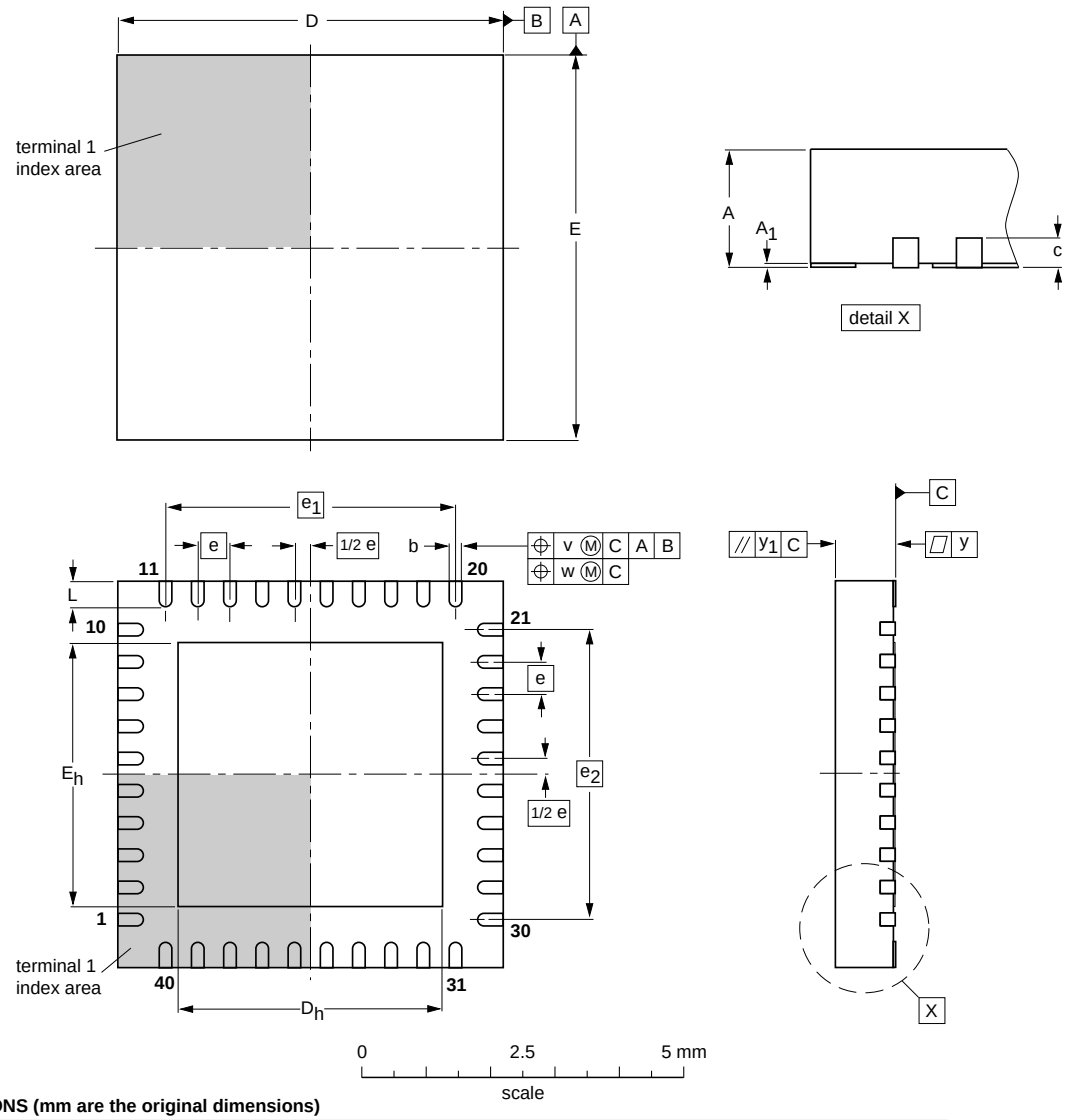
Table 32. LVDS DDR output register 2 (address 0022h) bit description

Default values are highlighted.

Bit	Symbol	Access	Value	Description
7 to 4	-		0000	not used
3	BIT_BYTE_WISE	R/W		DDR mode for LVDS output
			0	**bit wise (even data bits output on DAV rising edge/odd data bits output on DAV falling edge)**
			1	byte wise (MSB data bits output on DAV rising edge/LSB data bits output on DAV falling edge)
2 to 0	LVDS_INT_TER[2:0]	R/W		internal termination for LVDS buffer (DAV and DATA)
			000	**no internal termination**
			001	300 Ω
			010	180 Ω
			011	110 Ω
			100	150 Ω
			101	100 Ω
			110	81 Ω
			111	60 Ω

12. Package outline

HVQFN40: plastic thermal enhanced very thin quad flat package; no leads; 40 terminals; body 6 x 6 x 0.85 mm **SOT618-1**



DIMENSIONS (mm are the original dimensions)

UNIT	$A^{(1)}$ max.	A_1	b	c	$D^{(1)}$	D_h	$E^{(1)}$	E_h	e	e_1	e_2	L	v	w	y	y_1
mm	1	0.05 0.00	0.30 0.18	0.2	6.1 5.9	4.25 3.95	6.1 5.9	4.25 3.95	0.5	4.5	4.5	0.5 0.3	0.1	0.05	0.05	0.1

Note

1. Plastic or metal protrusions of 0.075 mm maximum per side are not included.

13. Revision history

Table 33. Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes
ADC1210S_SER v.3	20120702	Product data sheet	-	ADC1210S_SER_2
ADC1210S_SER v.2	20101223	Product data sheet	-	ADC1210S_SER_1
Modifications:	• Data sheet status changed from Preliminary to Product. • Text and drawings updated throughout entire data sheet. • SOT618-6 changed to SOT618-1. See Table 1 “Ordering information” and Figure 35 “Package outline SOT618-1 (HVQFN40)”. • Section 10.4 “Typical characteristics” added to the data sheet.
